

# In pursuit of Technology

June 18, 2008

*Real world solutions designed to catch criminals fast*

## Product Spotlight

### StarPath Technologies introduces “Electronic Pursuit Technology”.

What if you had the advantage over the criminals in a chase, a surveillance or even a bank robbery? What if you knew right where they were every second? StarPath Technologies gives you the tools to catch criminals by electronically tracking every move they make.

SPM is a browser-based AVL system (*Automatic Vehicle Location*) that is easily deployed and visually monitored by every police vehicle. Imagine tracking suspects right from the comfort of your own police car. Whether it is a marked patrol car or undercover vehicle, you will see the location of suspects in relation to your vehicle.

As you maneuver your police vehicle, you will see exactly where the suspect is traveling on a moving map of your area. Location updates can be obtained as quick as every

second. No more waiting for useless device pings that provide unacceptable delays. Look at the information in real-time and bring the suspect down.

In a world where smash and grabs are now prevalent, thefts from delivery trucks are frequent and bank robberies are on the rise, you now have the opportunity to deploy a variety of size GPS/CDMA devices that will allow you to track criminals down and make the arrest.

Simply deploy the appropriate device and then go back to work. No more wasted hours waiting for suspects that are never going to show up on that particular date and time. When the suspect takes the bait you will see the target on the move. Use the map in your police vehicle, track the target to the exact location on the street they are traveling and then pull them over for the arrest.

Officer safety is another feature of the StarPath Mobile software. When deployed with an impact switch in a police vehicle, StarPath Mobile can alert dispatchers and supervisory personnel that a police vehicle was involved in an accident. This enables dispatchers to look at the map and deploy emergency

personnel to that site.

When serious accidents occur, officers may not be able to use their radio for any number of reasons. StarPath Mobile can help ensure that notification is made to dispatch emergency crews when officers cannot.

StarPath Mobile can also serve as your electronic partner in high speed chases. Now for the first time, officers do not have to call out their location and can concentrate on driving the police car, which creates a safer environment for officers and the general public.

Dispatch personnel and other police vehicles will be able to see the location and direction of travel of the lead chase car and can use that information to assist the officer involved in the chase.

If the officer jumps out of the police vehicle to pursue the felon, StarPath Mobile lets everyone know right where his vehicle is. This enables the officer the freedom to direct their attention to confronting the criminal, assured that everyone knows where they are. **For additional information contact StarPath Technologies at (888) 674-4872.**
